github.com/tejas256
New York, NY

CORE COMPETENCIES

Production Reliability & Incident Response

Large-Scale Distributed Systems

Event-Driven Architecture

Full-Stack Development

REST API Design

LLM / Agentic AI

CI/CD & DevOps

Redis (Queueing, Caching, Locking)

Cloud Infrastructure (AWS)

EDUCATION

M.S. Computer Science

New York University (Courant Institute)

Aug 2024 - May 2026

Distributed Systems, Fundamental Algorithms, Big Data Application Development, Advanced Database Systems, GPUs, Multicore Processors

B.Tech. Computer Science & Engineering

National Institute of Technology Karnataka

Jul 2017 - May 2021

SKILLS

Languages

Python, Java, C++, TypeScript, JavaScript, SQL, Scala, Bash, HTML/CSS

Frontend/Full-Stack

React, Ant Design (antd), Node.js, Server-Sent Events (SSE), WCAG accessibility, Fuse.js, responsive UI/UX

Backend

Flask, REST APIs, Spring Boot, Event-Driven Architecture, Redis (queueing, caching, distributed locking, LLM response caching), PII/data-leak detection pipelines, SSRF/TLS hardening

Cloud/Infra

AWS (Lambda, ECS, SQS, SNS, API Gateway, CDK, Batch, Athena, DynamoDB, CloudWatch, SES, IAM), Docker, Kubernetes

Data/Databases

PostgreSQL, DynamoDB, Snowflake, Redis, SQL query optimization, ETL pipelines

AI/LLM/Agentic

Model Context Protocol (MCP) servers, LangGraph, Claude API, LLM orchestration, prompt engineering, multi-agent orchestration

Testing/Tooling

Playwright automation, CUDA, OpenMP, Git, Axe DevTools

Tejas Choudhary

SOFTWARE ENGINEER - DISTRIBUTED SYSTEMS & AI/AGENTIC PLATFORMS

PROFESSIONAL SUMMARY

Software engineer with 3+ years of industry experience across Amazon (SDE I → SDE II) and an AI startup, plus an NYU MSCS (Courant Institute of Mathematical Sciences). Built large-scale distributed systems, event-driven microservices, and AWS-native architecture, alongside full-stack web applications (React/TypeScript, Flask, Node.js) and modern AI/agentic tooling (LLM orchestration, Model Context Protocol servers, LangGraph). Known for closing out problems other engineers had already attempted and stalled on, from production incidents to years-old cross-team bottlenecks. Shipped production services processing \$50M/month in transactions with zero availability incidents, and built AI infrastructure serving hundreds of concurrent users in production.

WORK EXPERIENCE

New York University

May 2025 - May 2026

API Development Intern New York, NY

- Saved **~40 engineering hours weekly** by proposing and independently building custom Model Context Protocol (MCP) servers for GitHub and Google Workspace, enabling AI agents to autonomously triage and resolve internal repository issues.
- Owned end-to-end development of internal university platforms, building **Flask REST APIs** handling hundreds of daily requests and the corresponding React/TypeScript frontend, built with the Ant Design (antd) component library and featuring reusable dashboard components, responsive layouts, and client-side form validation logic.
- Implemented **WCAG accessibility** compliance across the React UI (verified with Axe DevTools) and introduced client-side fuzzy search using Fuse.js.

Amazon

Oct 2023 - Jul 2024

Software Development Engineer II Bangalore, India

- Closed out a recurring high-severity production incident that had stuck order workflows piling up after prior engineering attempts had stalled, by identifying an upstream data-confirmation gap and shipping **workflow-level terminal-state handling** across a large shared codebase, complying throughout with Amazon's strict, multi-team approval process for shared payment workflows.
- Spearheaded the integration of an org-wide centralized configuration store, standardizing legacy hardcoded parameters into a single scalable schema and negotiating adoption roadmaps with owners of **40+ downstream services**.
- Recovered **~\$500K+ in annual customer value** and eliminated 30,000+ annual customer contacts by designing, implementing, and releasing an event-driven Prime auto-refund service from the ground up (API Gateway, ECS, Lambda, SNS/SQS, DynamoDB).
- Conducted **200+ peer code reviews** and led design reviews introducing event-driven architecture patterns, establishing engineering standards that were later adopted across multiple other Amazon teams.

Amazon

Jul 2021 - Sep 2023

Software Development Engineer I Bangalore, India

- Authored the AWS CDK infrastructure for a seller disbursement payment method that reliably withstood massive production traffic, scaling to **1M+ active users** and **~\$50M/month** in transaction volume with zero availability incidents.
- Built a standardized cross-team launch playbook spanning **100+ changes across 30+ teams** within and outside the payments org, referencing 300+ code/config changes: for every dependent service, it mapped the specific change required, the owning team and its purpose, the test and launch process, and the permissions/approvals needed — backed by debugging guides, suggested roadmaps, workstream breakdowns, and resource references from prior launches.
- Used that playbook to slash the Belgium payments launch from **8 months to 2 months** and enable a 2-engineer team to deliver the subsequent Ireland launch in just 2 weeks; the same playbook was later adopted by MENA, LATAM, and APAC teams launching payments in their own new marketplaces.
- Designed a dual-pipeline PII data leak detection service covering **20+ Tier-1 services** using AWS Athena and AWS Batch, mentoring 2 interns through its delivery from architecture design to onboarding high-traffic services, and surfacing and remediating real data leakage in legacy codebases.
